Background:
In May 2012, health departments in WA State revised PS programs to promote HIV testing.

Methods:
Partnership Services Intervention:
• Medical providers in Washington State complete STI case report forms that include gender of partner, allowing health departments to identify MSM for potential intervention.
• In May 2012, health departments in WA State revised PS programs to promote HIV testing through public health.

Results:
• HIV incidence decreased and was more likely to test for HIV.

Conclusions:
• HIV testing and diagnosis occurs prior to PS intervention, particularly in specialty settings.
• More MSM with bacterial STIs were newly diagnosed during the intervention period, and there was a trend toward an increase in the proportion of all STIs diagnosed with HIV.

Limitations:
• Most HIV testing and diagnosis occurs prior to PS intervention, particularly in specialty settings.

Acknowledgments:
This program and evaluation were supported by the U.S. Centers for Disease Control and Prevention (CDC).
